

# Safety Action Bundle: Surgical Site Infections (SSI) – Colorectal Surgeries

## Background

- Surgical site infections (SSI) are the most common and costly reported health care-associated infection (HAI). Colorectal surgery SSI rates range from 5% to 45%.
- SSIs contribute to significant patient morbidity, mortality, prolonged hospital stays, readmissions and the need for subsequent procedures.
- SSIs are believed to account for \$3.5 billion to \$10 billion annually in healthcare expenditures.
- Up to 60% of SSIs have been estimated to be preventable by using evidence-based guidelines.

## Aim

To reduce the incidence of Colorectal Surgical Site Infections by **20%** by September 28, 2017.

*\* Hospitals in top quartile (zero) should focus on maintenance and hardwiring.*

## Measures

*Outcome:* Colorectal Surgical Site Infections Rate per Centers for Medicare and Medicaid (CMS) and State Law **D**

*Process:* SSI Colon Bundle Elements **D**

*Submit:* National Healthcare Safety Network (NHSN) **D**

Lower is better

## Core Strategies

Definition **D**

Reference **i**

Tool **X**

<b>Patient and Family Engagement</b>	<ul style="list-style-type: none"> <li>□ Educate patient and family on what to expect throughout the surgical experience and identify discharge needs.</li> <li>□ Encourage and support patient and family participation in care planning and decision making by providing tools like the Centers for Disease Control (CDC) “Frequently Asked Questions about <i>Surgical Site infections</i>”. <b>X</b></li> <li>□ Educate patient and family on the significance of hand hygiene and impact on SSI prevention.</li> </ul>
<b>Leadership</b>	<ul style="list-style-type: none"> <li>□ Identify a multidisciplinary team that includes senior and unit-level leadership, perioperative clinical providers, infectious disease and prevention, pharmacy and quality personnel.</li> </ul>

	<ul style="list-style-type: none"> <li>□ Set aims, goals and timelines for practice changes and performance.</li> <li>□ Educate care providers on risk factors for SSI and prevention with an emphasis on bundle elements and evidence-based best practices.</li> </ul>
<p><b>Pre-Operative Period</b></p>	<ul style="list-style-type: none"> <li>□ Provide education to patient in the office/clinic when the decision is made for operation on “Preventing SSIs” and ensure understanding. Include information about the importance of pre-operative bowel prep and oral antibiotics and consider providing the antibiotics.</li> <li>□ Ensure patient had a Hibiclens shower night before and day of surgery.</li> <li>□ Use 2% chlorhexidine gluconate (CHG) cloths on the morning of surgery, if no CHG shower or BMI &gt;30.</li> <li>□ Screen and identify patients at risk for hyperglycemia and implement a glucose control protocol. Every patient should have a fasting glucose checked during the 30 days before the operation. Anyone with a glucose &gt;100 should have intra-operative glucose screening.</li> <li>□ Ensure weight-based antimicrobial prophylaxis administered within 1 hour prior to incision. (Ideally, antibiotics are given by anesthesia in the OR.)</li> <li>□ If hair removal is needed, use clippers and not razors, outside of the operating room.</li> <li>□ Actively warm all patients for at least 30 minutes BEFORE going into the OR.</li> </ul>
<p><b>Intra-Operative Period</b></p>	<ul style="list-style-type: none"> <li>□ Pause and have surgical team review surgical checklist. Establish teamwork, culture of safety and open communication.</li> <li>□ Skin Prep: Wash and clean skin around incision site using a 2% CHG product with alcohol.</li> <li>□ Maintain normothermia. Standardize procedures for active warming in the operating room (Maintain body temp <math>\geq 96.8^{\circ}</math> F/<math>36.0^{\circ}</math>C) (warming blankets/warm fluids).</li> <li>□ Ensure weight-based re-dose of antimicrobial agents within 3-4 hours after incision (use timer/electronic reminder in anesthesia record).</li> <li>□ Optimize tissue osugentation by administering supplemental oxygen (FiO2 = or &gt; 80%).</li> <li>□ Measure glucose in OR 30-60 minutes after incision and use insulin to control if level above 160.</li> <li>□ Consider wound-edge protectors.</li> <li>□ Use dedicated wound closure tray for closure of fascia and skin.</li> <li>□ Glove and gown change by entire team after anastomosis completed and before fascial closure.</li> </ul>

<p><b>Post-Operative Period</b></p>	<ul style="list-style-type: none"> <li>□ Discontinue antibiotics when patient leaves the OR.</li> <li>□ Maintain blood glucose during the postoperative period at 160mg/dl or lower.</li> <li>□ Optimize tissue oxygenation by administering supplemental oxygen.</li> <li>□ Promote a patient shower with Hibiclens after dressing removal.</li> <li>□ Promote good hand hygiene practices with patient/family and provide hand sanitizing products at bedside.</li> <li>□ Reinforce patient education about SSI prevention measures and objectives.</li> </ul>
<p><b>Post-Hospitalization Period</b></p>	<ul style="list-style-type: none"> <li>□ Educate patient on wound care and signs and symptoms of infection.</li> <li>□ Follow-up phone call to patient within one week.</li> </ul>
<p><b>Performance and Variation</b></p>	<ul style="list-style-type: none"> <li>□ Measure and provide on-going feedback of Colorectal SSI rates with perioperative personnel and leadership.</li> <li>□ Investigate any SSI Colon that occurs and document if all elements of the bundle were completed.</li> </ul>

**Moving Towards Zero**

<p><b>Daily Monitoring of SSI Colon</b></p>	<ul style="list-style-type: none"> <li>□ Create and implement an SSI Colon bundle checklist based on the evidence-based guidelines and best practices.</li> <li>□ Monitor adherence to SSI Colon prevention bundle elements to identify gaps and opportunities for improvement.</li> <li>□ Collect SSI Colon rates by clinical provider to identify potential opportunities.</li> </ul>
---	---

**Hardwiring**

<p><b>Culture</b></p>	<ul style="list-style-type: none"> <li>□ Promote a blame-free environment where individuals are able to report errors or near misses without fear of reprimand or punishment.</li> <li>□ Encourage collaboration across ranks and disciplines to seek solutions for patient safety problems.</li> <li>□ Promote transparency of results from display on units to the board and public.</li> </ul>
