

Meds 360° Medication Management

Reliably fill in the blanks of medication usage for 265 million patients, from what's been prescribed to what's being picked up, including cash-paid prescriptions.

Real-time medication information, beyond the walls of your institution.

Unlike EMR medication data which only provides information for medications prescribed within your institution, Meds 360° delivers the most up-to-date and comprehensive medication lists, spanning all prescribers and all retailers from within your institution and beyond.

Manage adherence and medication risk.

See the past 12 months of your patients' medication history and be alerted to dangerous drug combinations, therapeutic duplications, dose changes, and potential abuse to help determine compliance, improve adherence, spot abusable drug risk, and support care decisions.

See the big picture.

Unlike raw medication data feeds, the Meds 360° interface has been painstakingly crafted to make patient medication data usable to help make more informed care decisions.

Patients are often unreliable when it comes to remembering their medications. With Meds 360°, my team can quickly identify what's been prescribed, if the patient picked it up, and easily follow up with the patient to determine the drug's effectiveness and adjust regimens accordingly.

Aalap Modi

Director of Clinical Care Services
CPS Telepharmacy

BEFORE MEDS 360°

An incomplete patient picture: **frustrating, unsafe and expensive.**

AFTER MEDS 360°

Fewer blanks and gaps: **safer, more informed, more effective care.**

Inaccessible Info

Medication and patient history data locked in individual EMRs with little to no cross-over.

Accessibility

Connectivity

Across EMRs and all major pharmacy networks, covering 256 million patients and growing every day.

Wrong Info

Limited in breadth as they are, EMRs show e-prescribe data, which doesn't get to patient behavior – and patients aren't always the most reliable narrators.

Accuracy

Right Info

Retail point of sale and claims data tells the whole story of what the patient is **actually doing** creating more consistent, effective care.

Safety Risks

Non-Adherence, possible interactions and abuse left undetected because of lack of clinical history over time.

Safety

Improved Patient Safety

More complete meds information means the ability to catch potential drug interactions, clock patient adherence and see patterns that could signal abuse.
